## Gas Cherenkov Detector

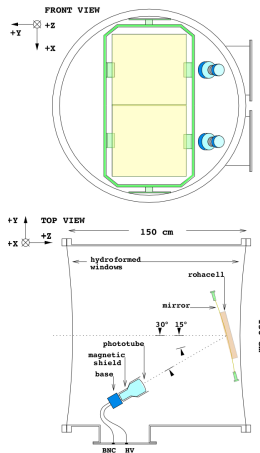

Shuo Jia

# HMS Gas Cherenkov Detector

A Large cylindrical tank which containing two mirrors which focus light onto two 5 inch Burle8854 multiplier photo tubes.

$$\phi_{in} = 59'', L = 60''$$

The tank is filed with 0.5 atm C<sub>4</sub>F<sub>8</sub>O, which have pion threshold of around 3.8 or 3.9 GeV/c.

$$\cos(\theta) = \frac{c}{vn} = \frac{1}{\beta n} = \frac{\sqrt{p^2 + m^2}}{np}$$

e

pi

pi

For a given Cherenkov device, the Number of photoelectrons detected is

$$N_{p.e.} = L \frac{\alpha^2 z^2}{r_e m_e c^2} \int \epsilon(E) \sin^2 \theta(E) dE$$

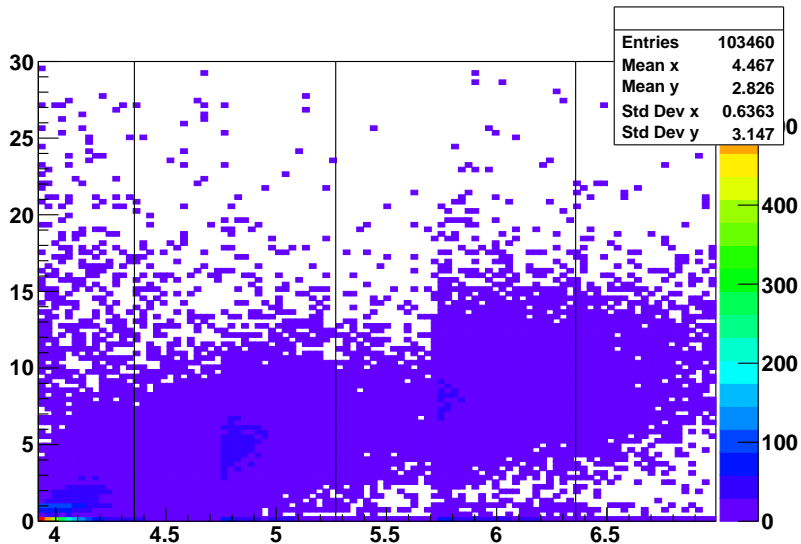

We define Cherenkov detector quality factor  $N_0$

$$N_0 = \frac{\alpha^2 z^2}{r_e m_e c^2} \int \epsilon dE$$

so that,

$$N_{p.e.} \approx L N_0 \langle \sin^2 \theta \rangle = L N_0 \frac{(n^2 - 1) P^2 - m^2}{n^2 p^2}$$
